

Natural Language Processing and Speech Recognition

Natural Language Generation

Learning Objectives

By the end of this lesson, you will be able to:

- Explain various Natural Language Generation models
- O Define Language Modeling
- Explain the challenges in NLP and how sentence correction works
- Create AIML patterns
- Predict the next suitable word in a sentence

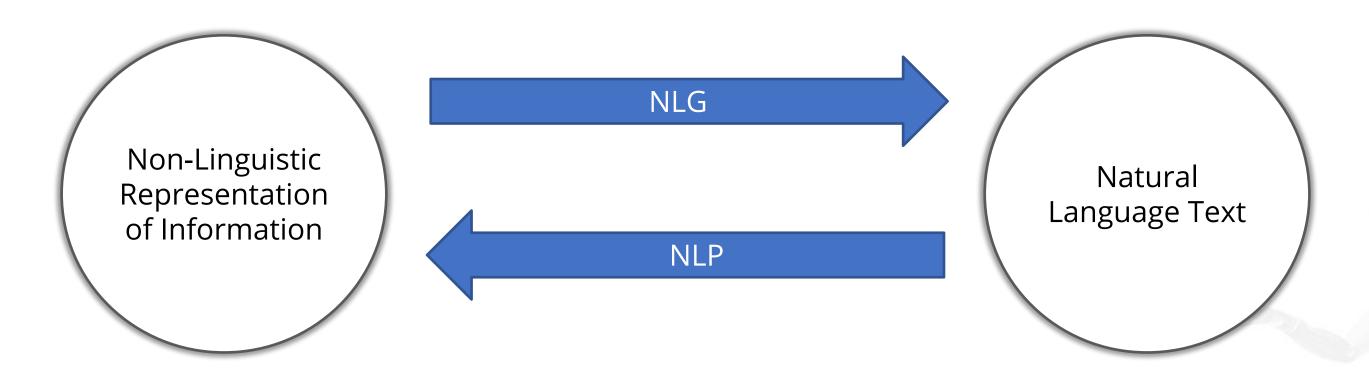

Introduction to NLG

What Is NLG?

It is a part of artificial intelligence and computational linguistics that mainly focuses on computer systems which can produce understandable text in human languages.

It converts a computer-based representation into natural language representation which is the opposite process of Natural Language Understanding.

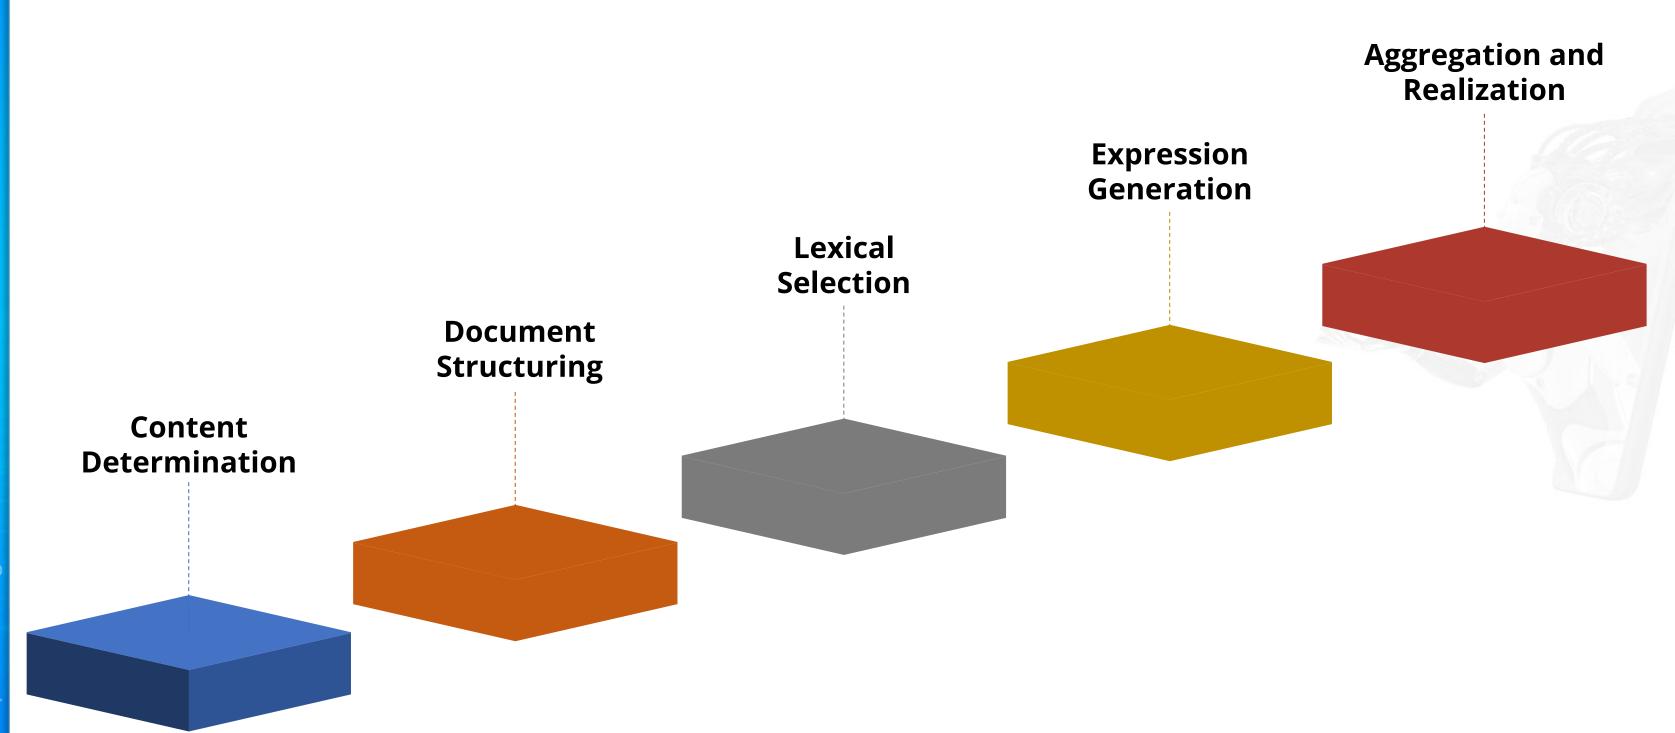

NLU and NLG Conversion

Data Stream, Log Files, Semantic Information

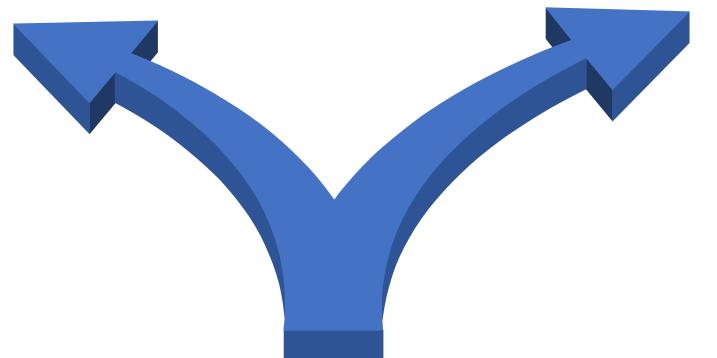

Reports, Explanations, Summaries, Recommendations, and Narratives

Stages in NLG

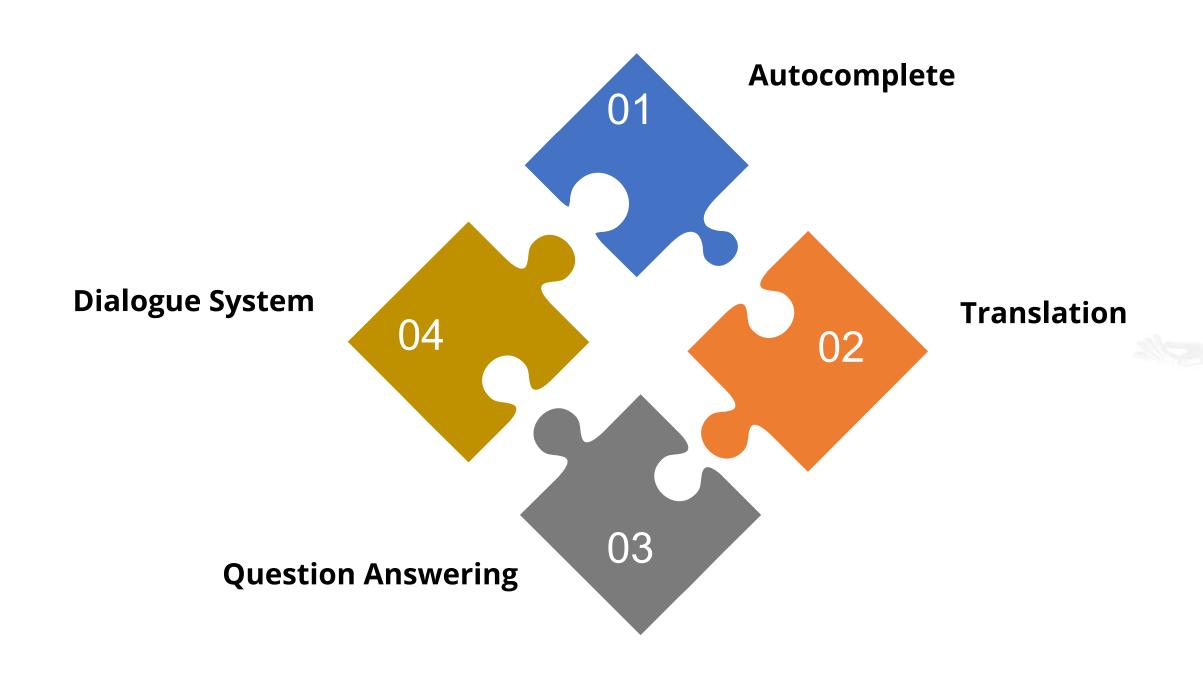

Response Generation Mechanism

Generative-Based Model

Retrieval-Based Model

Applications of NLG

Retrieval-Based Model

Retrieval-Based Model: Introduction

The model creates responses from a bunch of predefined patterns

Input and context are important parameters to pick the responses

It uses heuristics to fetch the best result from the available responses

The score is generated for picking the relevant responses

Retrieval-Based Model: Pros

Less chances of error as the system consists of grammatically correct responses

Suitable for customer satisfaction and business problems

Requires less effort and data

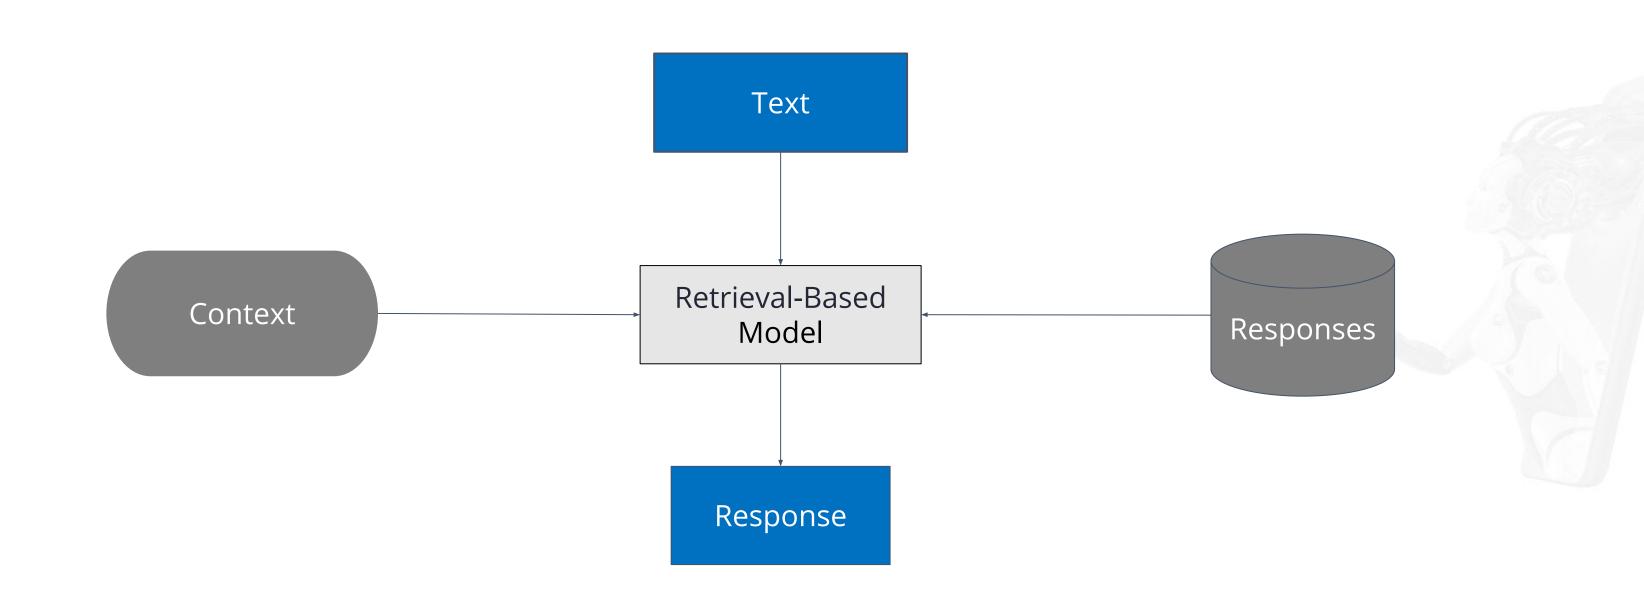

Retrieval-Based Model: Cons

No new text generation possible due to its fixed nature

Lots of heuristics are written due to which the system is not intelligent

Can handle only predefined scenarios

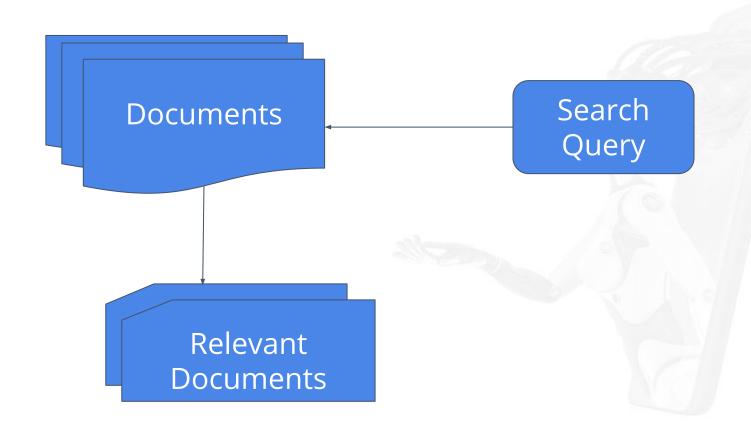

Retrieval-Based Model: Architecture

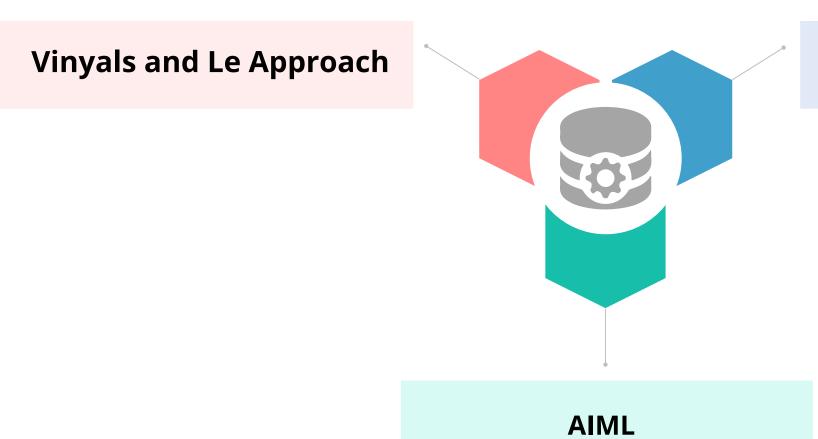

Retrieval-Based Model: Example

Search Engine or Document Retrieval System:

- It is used in information retrieval systems
- Knowledge base is set of documents and input is a search term or query
- Task is to retrieve documents that are most relevant to the search query

Retrieval-Based Model: Tools

Artificial Intelligence Markup Language (AIML)

AIML: Introduction

XML based markup language

Pattern-based heuristics

Easy to understand and highly maintainable

Programming language, an Extensible Markup Language (XML)

Useful in creating artificially intelligent applications

AIML: Introduction

AIML is used in:

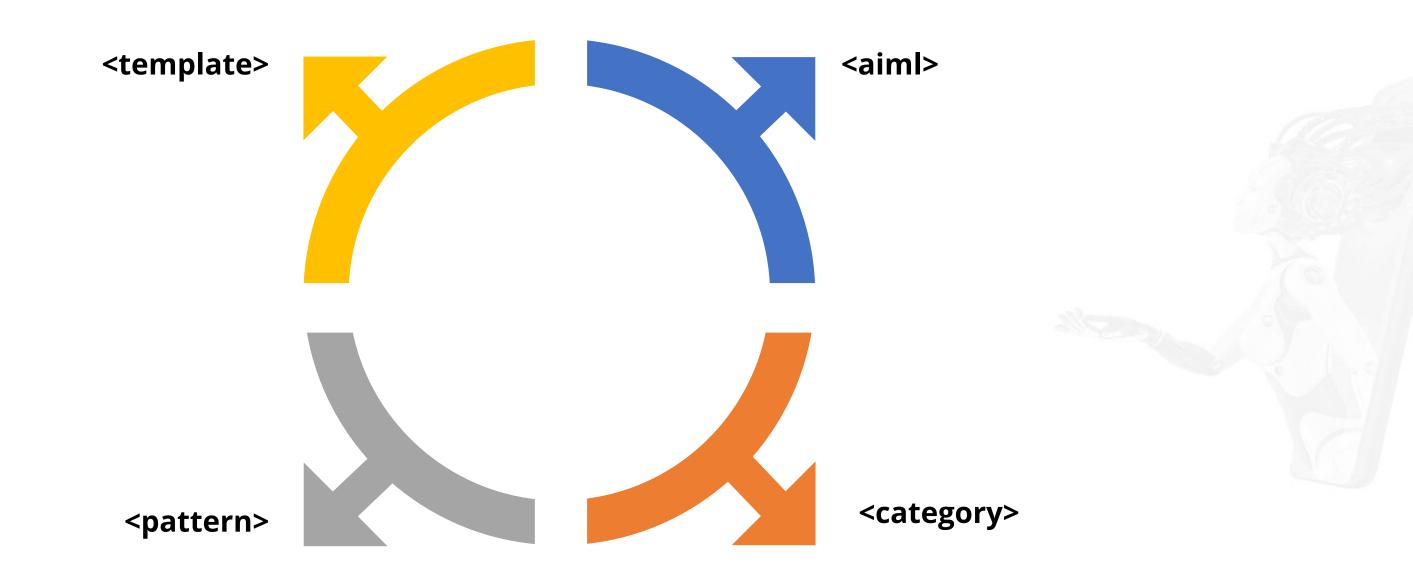

AIML: History

Developed by the Alicebot free software community and Dr. Richard S. Wallace

1995

- It is used to create Alicebot.
- A.L.I.C.E. (Artificial Linguistic Internet Computer Entity) is a chat box application.
- AIML interpreters are available in Java, Ruby, Python, C++, C#, and Pascal.

AIML: Elements

AIML: Tags

Sr.No	AIML Tags
1	<star> Used to match wildcard * characters in the <pattern> Tag</pattern></star>
2	<srai> Multipurpose tag, used to call or match the other categories</srai>
3	<random> Used <random> to get random responses</random></random>
4	Used to represent multiple responses
5	<set> Used to set value in an AIML variable</set>
6	<get> Used to get value, stored in an AIML variable</get>
7	<that> Used to respond, based on the context in AIML</that>
8	<topic> Used in AIML to store a context</topic>
9	<think> Used to store a variable in AIML without acknowledging the user</think>
10	<condition> Helps ALICE to respond to the matching input</condition>

AIML: Example

```
<category>
  <pattern>WHAT IS YOUR DOB?</pattern>
  <template>My DOB is 15/08/1990</template>
</category>
<category>
  <pattern>WHEN IS YOUR BIRTHDAY?</pattern>
  <template>
        <srai>What is your DOB?</srai>
        </template>
        </template>
        </template>
        </template>
        </template>
        </template>
        </template>
        </template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></template></templa
```

Creating AIML Patterns

Problem Statement: A retrieval-based model is used to create response for questions asked by the user. These are predefined responses in the addition to the slots. Create AIML patterns for QnA on mental wellness.

Access: Click on the **Practice Labs** tab on the left side panel of the LMS. Copy or note the username and password that is generated. Click on the **Launch Lab** button. On the page that appears, enter the username and password in the respective fields, and click **Login**.

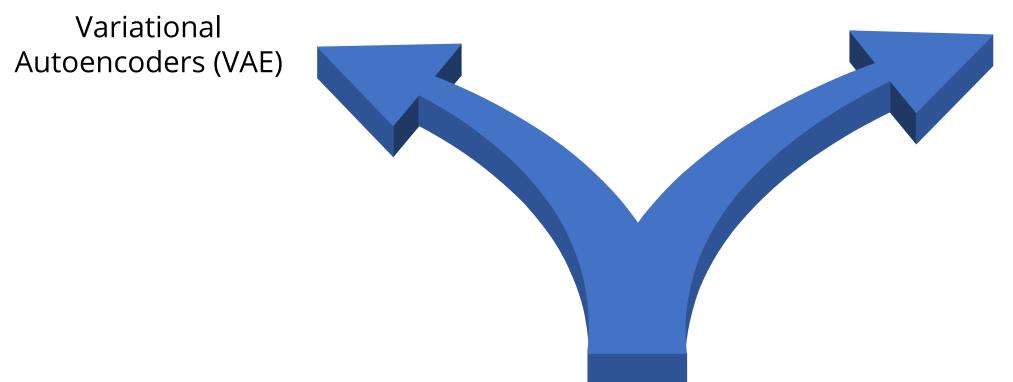

Generative-Based Model

Generative-Based Model: Introduction

- Generative model is a statistical model of the joint probability distribution of X and Y:
 - X is observable
 - Y is target
- Describes how a dataset is created, in terms of a probabilistic model
- Learns any kind of data distribution, using unsupervised learning models

Generative-Based Model: Approaches

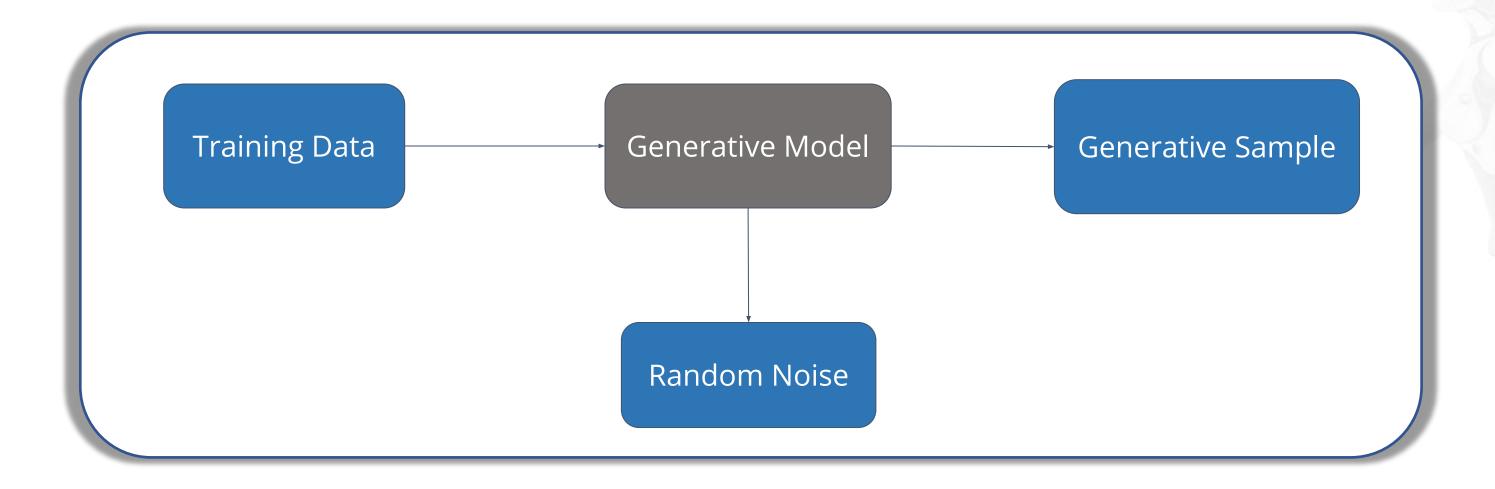

Generative Adversarial Networks (GAN)

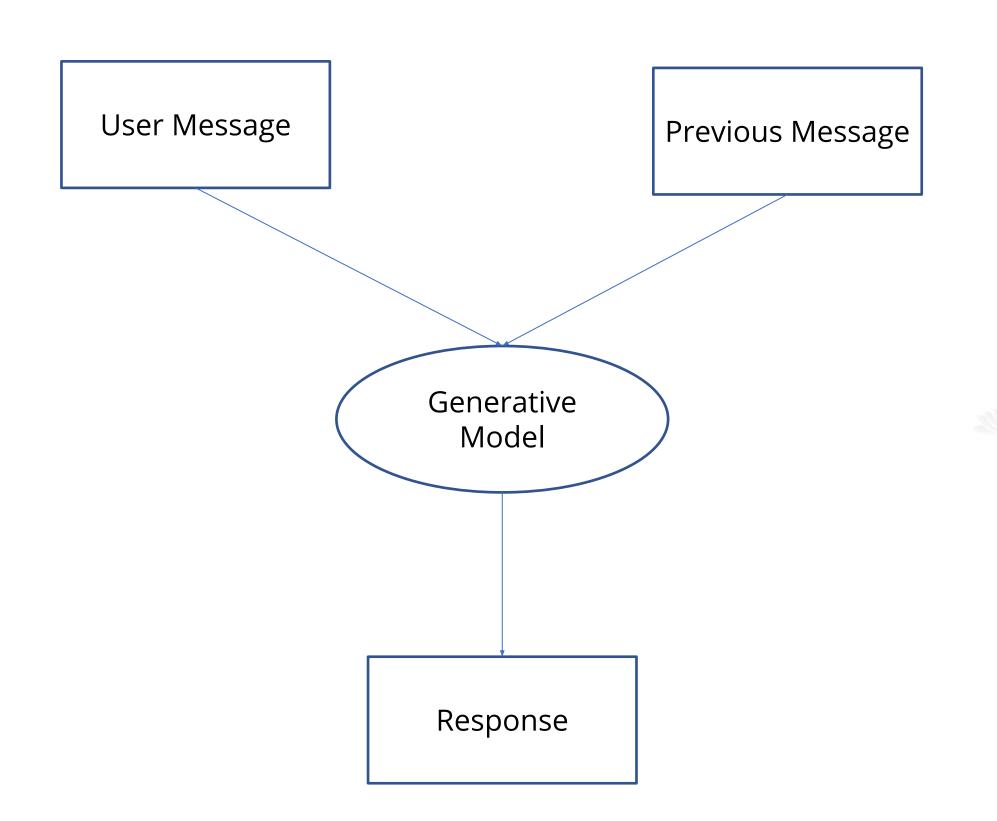

Generative-Based Model: Example

Create a model that can generate a new image of dog:

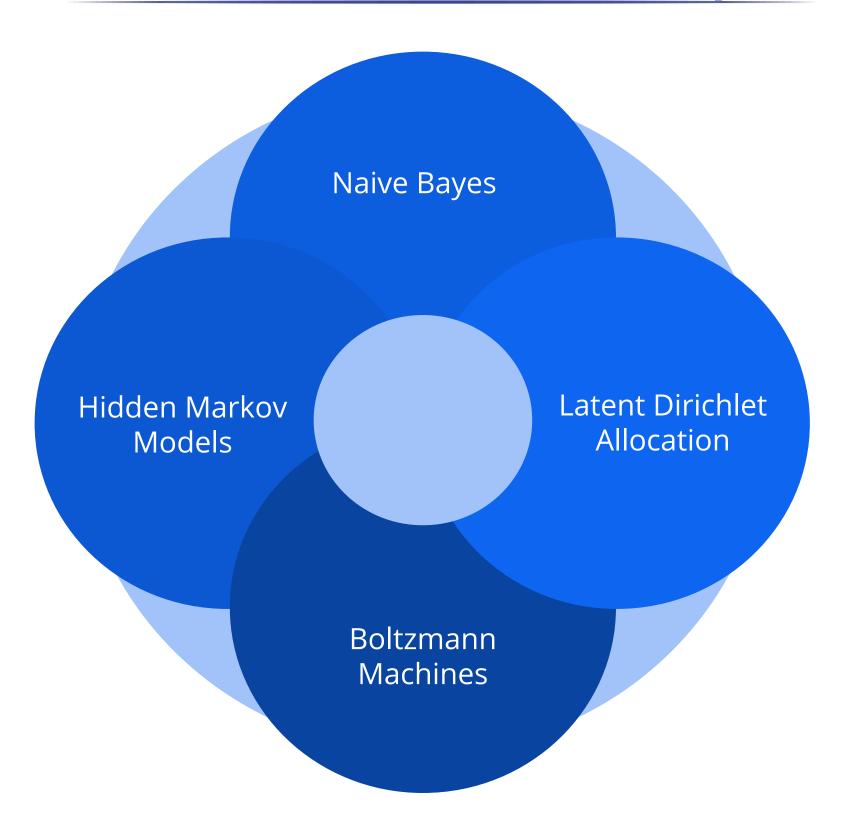

- Input: Dataset of dogs
- Model: To learn generic rules to create new outputs
- Output: New images of dogs

Generative-Based Model: Architecture

Generative-Based Model: Techniques

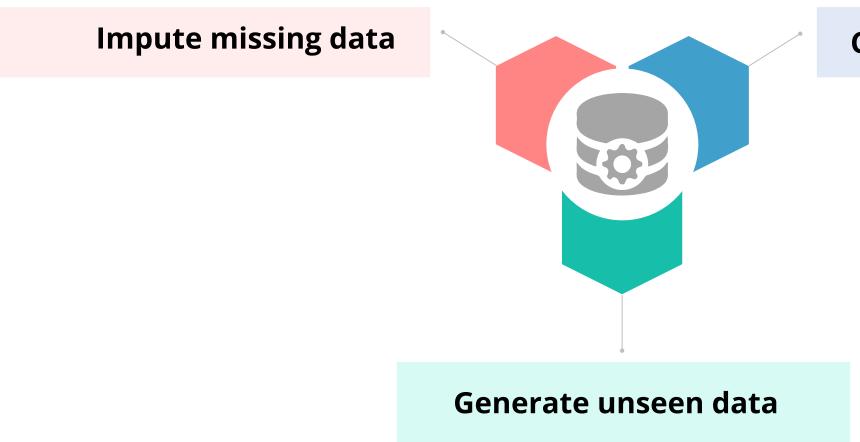

Generative-Based Model: Working

A generative model can be used to perform prediction: **argmaxy** P(Y=y|X=x)= **argmaxy** P(Y=y,X=x)/P(X=x) and since P(X=x) is constant on the RHS, this equals to **argmaxy** P(Y=y,X=x)

Generative models are capable of more than just prediction, i.e. maximizing P(Y|X=x). By estimating P(Y, X) and able to sample X, Y pairs

Generative-Based Model: Working

Generative model can be used to:

Compress the dataset

Language Modeling

Introduction to Language Modeling

One of the fundamental tasks of NLP that has many applications

Way of statistical analysis of natural language

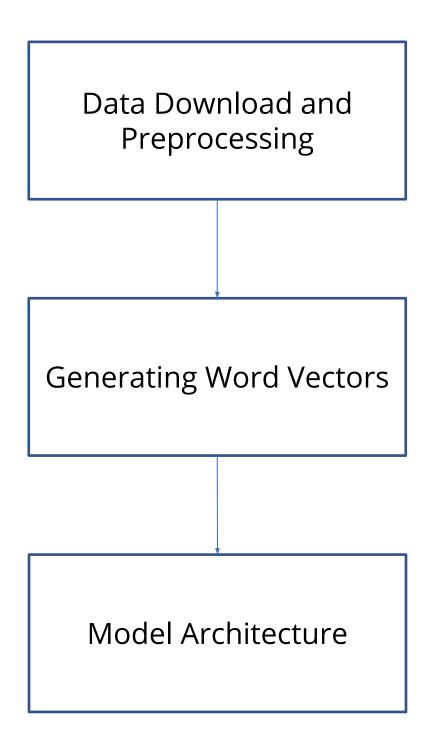

Used to compute a probability of a token

Introduction to Language Modeling

Language modeling is used for:

Next Word Prediction

Define Language Models

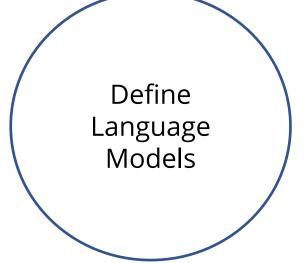

Applying Language Models to Data

Training and Testing

Calculate the probability of a sentence of sequence of words:

$$P(W) = P(w1, w2, w3, ..., wn)$$

Conditional probability or Chain rule

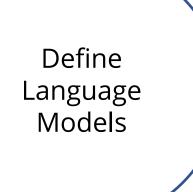

Markov Assumption:

The conditional probability distribution of future states depend upon the present state

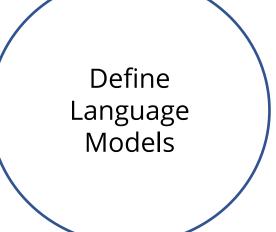

P(wi | w1, w2,..., wi-1) P(wi | wi-k,, wi-1)

K is number of words

N Grams:

- Unigram model
- Bi-Gram model

Data Preprocessing:-

- Removing any punctuation and lowercase all words
- Forming sentences with probabilities

Applying Language Models to Data

- Model fitting
- Model saving
- Testing is performed in the second step

Predict Next Word in a Sentence

Problem Statement: While writing something there are some systems that give you the prediction of next word based on the previous context. These are made by using huge trained data. Write a script to identify the next word in an email written to the manager for leave application.

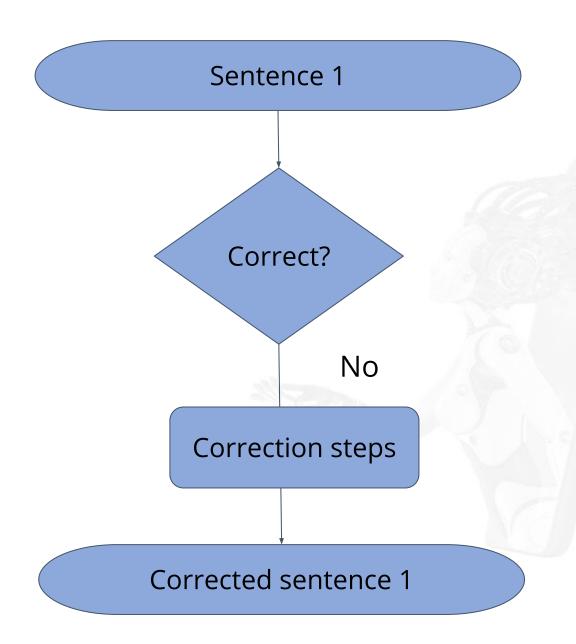

Access: Click on the **Practice Labs** tab on the left side panel of the LMS. Copy or note the username and password that is generated. Click on the **Launch Lab** button. On the page that appears, enter the username and password in the respective fields, and click **Login**.

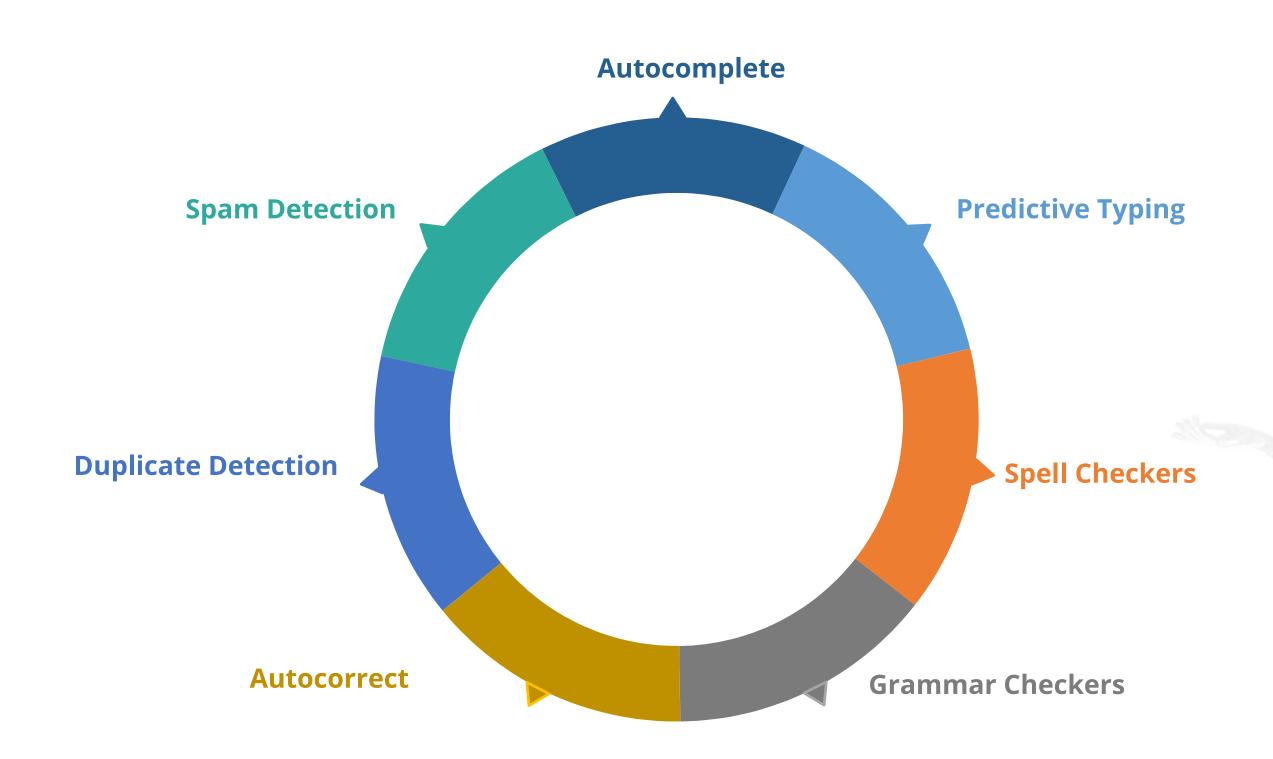

Sentence Correction

Introduction to Sentence Correction

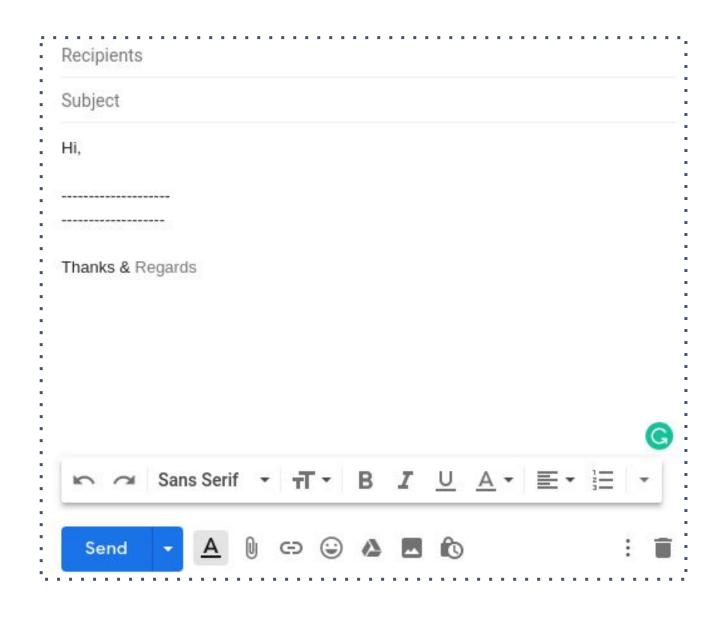

- Sentence correction is a task of correcting different kinds of errors in incoming text
- These errors are classified into:
 - Spelling
 - Punctuation
 - Grammatical
- Various types of error correction systems are available
- It is an important process of NLU and NLG

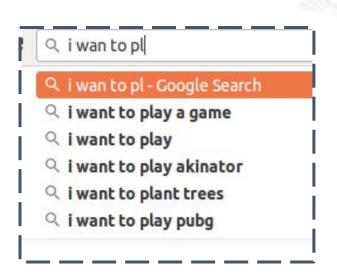

Error Correction Systems

Example of Sentence Correction

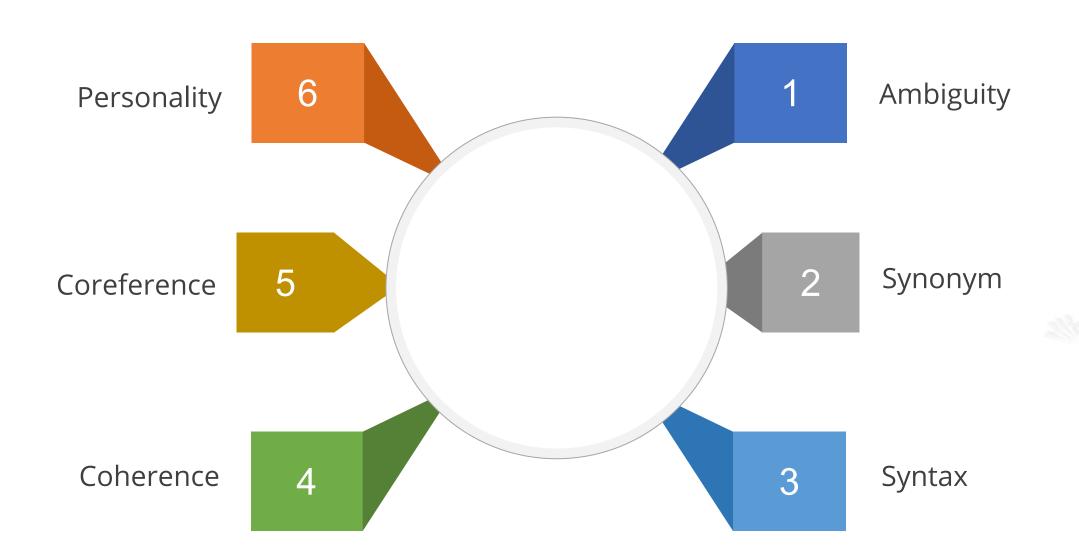

Basic Principles of Sentence Correction

There are two basic principles behind the spelling correction algorithms:

- 1 Choose the nearest one. It expects the proximity between a pair of queries.
- Select the one that is more common when correctly spelled queries. Example: grunt and grant both seem equally plausible.

Challenges in Sentence Correction

implilearn. All rights reserved.

Key Takeaways

You are now able to:

- Explain various Natural Language Generation models
- O Define Language Modeling
- Explain the challenges in NLP and how sentence correction works
- Create AlML patterns
- Predict the next suitable word in a sentence

DATA AND ARTIFICIAL INTELLIGENCE

Knowledge Check

In which of the following models, we produce predefined responses for a query?

- a. Retrieval-Based Model
- b. Generative-Based Model
- C. Statistical Model
- d. Topic Modeling

In which of the following models, we produce predefined responses for a query?

1

- a. Retrieval-Based Model
- b. Generative-Based Model
- C. Statistical Model
- d. Topic Modeling

The correct answer is

a.

Predefined patterns are used to generate the responses for a query in Retrieval-based model.

Which of the following are the uses of Natural Language Generation?

- a. Creating answers
- b. Prediction of next or previous word
- C. Autocomplete
- d. All of the above

Which of the following are the uses of Natural Language Generation?

2

- a. Creating answers
- b. Prediction of next or previous word
- C. Autocomplete
- d. All of the above

The correct answer is

NLG has all the capabilities for answer generation and correction.

Which of the following techniques are used in NLG?

- a. Trend analysis
- b. Market-based analysis
- c. TF-IDF
- d. RNN

Which of the following techniques are used in NLG?

3

- a. Trend analysis
- b. Market-based analysis
- C. TF-IDF
- d. RNN

The correct answer is

d.

RNN is used for seq2seq, Markove is for pattern analysis, N-gram for next word prediction.

What is AIML?

- a. Artificial Intelligence Markup Language
- b. Artificial Intelligent Modeling Language
- C. Artificial Intelligence Machine Language
- d. Artificial Intelligence Morphology Language

What is AIML?

4

- a. Artificial Intelligence Markup Language
- b. Artificial Intelligent Modeling Language
- C. Artificial Intelligence Machine Language
- d. Artificial Intelligence Morphology Language

The correct answer is

a.

AIM stands for Artificial Intelligence Markup Language.

Which one of the following creates a problem in NLG?

- a. Data ambiguity
- b. Autocomplete
- c. Creating answers
- d. Diversified answers

Which one of the following creates a problem in NLG?

5

- a. Data ambiguity
- b. Autocomplete
- c. Creating answers
- d. Diversified answers

The correct answer is

a

Data ambiguity creates problem in NLG.
